

Amendment to the Specification:

Please amend the Abstract on page 10 as follows:

An embodiment of USB device comprises a lookup table is in a fixed in electronically readable hardware such as a ROM inside of an integrated circuit responsible for controlling or interfacing with a USB bus. An index is read and used to pick an entry in the lookup table. That entry provides a Product ID that is combined with fixed vendor information to complete the identification information provided for in the USB specification medium comprising a plurality of product identification information entries. The USB device also has an electronically readable index that selects one of the plurality of product identification information entries, and the vendor identification information is stored in a location separate from the index.
